

FAST WMS SOFTWARE

Warehouse management systems (WMS) are best described as the advanced technology and operating processes that optimize all warehousing functions. These functions typically begin with receipts from suppliers and end with shipments to customers, and include all inventory movements and information flows in between. Warehouse management systems have typically been associated with larger, more complex distribution operations. Small, non-complex distribution facilities have historically not been viewed as candidates to significantly streamline operations and reduce costs.

In practice, successful WMS solutions are generally designed to merge computer hardware, software, and peripheral equipment with improved operating practices for managing inventory, space, labor, and capital equipment in warehouses and distribution centers.

FAST WMS SOFTWARE MODULE

**Item, Party and Store
Master**
